

INZONE Prototype Interview Discussion Guide

Interviewer: First, some background information

- What is your name and age? We need to record this for sampling purposes.
- What major are you, and what year are you?
- How many hours a day would you say you use your phone, on average?
- Would you say that certain apps on your phone make you feel certain ways, some making you feel happy while others not?
- Are there any apps that you feel, for certain, might cause you stress by interacting with them. If so, why?
- If you could change one thing about your current relationship with your phone and these stressful apps, what would it be?

Interviewer: Well, we are currently working as a product design class to actually help solve this issue regarding stressful apps. Would you be interested in learning more, and partaking in the sampling of some prototypes?

- What would you say is currently an app on your phone that might cause you stress to interact with?
- Would you be okay if we were to ask you to use that app as you would normally for 1 minute, and then use our prototypes to see how you feel after the stress-relief game?
- So 1 minute of using _____, then 1 minute of using the Stress Lock prototype, and I want you to just tell me how you feel. Sounds good?
- So now 1 minute of using _____, then 1 minute of using the Heartlock prototype, and I want you to tell me how you feel like last time, okay?
- So, one of our prototypes is unfortunately still in the works, but it actually extends the use of these two current prototypes, as a secondary application that can better get a sense of what apps cause you stress without you knowing.
- If you were given a chance to test out this prototype (show image), which could monitor and update you at any time about your current blood pressure and stress levels, what would you think about it?
- Would you use this prototype in conjunction with the others, or would you prefer a third app for this prototype specifically?

Interviewer: Finally -

- Which one, out of the 2-3 prototypes, was your favorite?
-]How does having your bpm on display or readily available feel, like if this were to be in an actual app?
- What, of the given prototypes, would you like to use again?
- Any other feedback?
